#### DETAILED ACTION

### Continued Examination Under 37 CFR 1.114

A request for continued examination under 37 CFR 1.114, including the fee set forth in 37 CFR 1.17(e), was filed in this application after final rejection. Since this application is eligible for continued examination under 37 CFR 1.114, and the fee set forth in 37 CFR 1.17(e) has been timely paid, the finality of the previous Office action has been withdrawn pursuant to 37 CFR 1.114. Applicant's submission filed on 23<sup>rd</sup> March 2009 has been entered.

## Claim Rejections - 35 USC § 102

The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless -

(b) the invention was patented or described in a printed publication in this or a foreign country or in public use or on sale in this country, more than one year prior to the date of application for patent in the United States.

Claims 1, 8, 9, 10, 12, 13 and 14 are rejected under 35 U.S.C. 102(b) as being anticipated by Hluchyj et al ("Queueing in High Performance Packet Switching," Hluchyj).

Claim 1: Hluchyj shows a multi-channel network node for routing/switching data from a number of input ports to a number of output ports (pg. 1588, fig. 2a & 2c: input and output queueing), wherein said data is buffered in a memory unit before being passed to a destined output port (pg. 1587, right-col. within para. A, lines 1-4: buffer on its input... awaits access to switch), wherein said multi-channel network node comorises:

Art Unit: 2416

said memory unit organized as a number of physical memory queues (pg. 1588, fig. 2a & 2c: input queues 1~N traverse "unit" to output queues 1~N), each queue being physically arranged so that it is physically assigned to an output port to an output port (pg. 1588, fig.  $2a - 1 \sim N:1 \sim N$  queues; fig.  $2c - 1 \sim N:1 \sim N$  queues; pg. 1589, left-col., sec. C lines 1-3: all queueing is done at the outputs of the switch with a separate b packet FIFO provided for each output), and

a switching unit (pg. 1588, fig. 1a: packet switch) for routing said data from the input port to said memory queue which is assigned to the destined output port (pg. 1588, fig. 1b and sec. B: NxN or NbxNb queueing/switching arrangement).

Claim 14: Hluchyj shows a method for routing/switching data from any input port to any of a number of output ports of a multi-channel network node (pg. 1588, fig. 1a: input queues 1~N through switch to output queues 1~N), comprising the steps of:

receiving data from a data channel by a receiver unit (pg. 1588, fig. 2a: inputs 1~N traverses through "receiver unit");

queueing said data in a plurality of memory queues constituting a memory unit (fig. 2a & 2c: input queues / output queues units), wherein each memory queue is physically arranged so that it is physically assigned to an output port (pg. 1588, fig. 2a – 1~N:1~N queues; fig. 2c – 1~N:1~N queues; pg. 1589, left-col., sec. C lines 1-3: all queueing is done at the outputs of the switch with a separate b packet FIFO provided for each output); and

switching/routing the data from the memory queues to the output port the respective memory queue is assigned to (pg. 1593, left-col. sec. C 1st para. – b packet FIFO... destined for tagged output).

Art Unit: 2416

Claim 8: Hluchyj teaches a matrix switch (fig. 1a: non-blocking switch is a matrix switch).

Claim 9: Hluchyj teaches the switching unit is provided by a processor controlled by software (fig. 1a: the switch *must* be inherently run by a CPU controlled by codes).

Claim 10: Hluchyj teaches input and output interfaces are assigned to the input (fig. 2a: input interface; pg. 1587, right-col. within para. A, lines 1-4 & 8-10: a separate buffer is placed on each input... addressed to different output) and output ports respectively (fig. 2c: output interface; pg. 1593, left-col. sec. C 1st para. – b packet FIFO... destined for tagged output).

Claim 12: Hluchyj shows the output ports are output ports of the memory unit and are coupled with a switching unit (fig. 2a & 2c input and output queues are coupled to switch in fig. 1a).

Claim 13: Hluchyj shows the output ports are the output ports of the network node (fig. 2c: output queues 1-N of unit / node; or, fig. 1a: output queues 1-N of switch node).

### Claim Rejections - 35 USC § 103

The text of those sections of Title 35, U.S. Code not included in this action can be found in a prior Office action.

Claims 2, 3 and 15 are rejected under 35 U.S.C. 103(a) as being unpatentable over Hluchyj et al ("Queueing in High Performance Packet Switching," Hluchyj) in view of Dahlgren et al (US 2003/0115402 A1, Dahlgren).

Art Unit: 2416

Claim 2: Hluchyj discloses the claimed invention; yet not specifically "each of said memory queues comprises a number of coherent memory cells." Dahlgren teaches each memory queue comprises a number of coherent memory cells (abstract: cachecoherent memory). It would have been obvious to one of ordinary skill in the art when the invention was created to modify the queues or memory of Hluchyj into coherent memory cells as taught by Dahlgren to manage data (in cache) conflicts and maintain consistency between cache and memory.

Claim 3: Hluchyj discloses the claimed invention; yet not specifically "the number of memory cells is resizable in order to redistribute buffer capacity of the memory queues." Dahlgren teaches concept of number of memory cells being resizable ([0064] lines 1-9 & [0066] lines 1-10: memory... dynamic resizing... to a cache coherence protocol). It would have been obvious to one of ordinary skill in the art when the invention was created to modify the queues or memory of Hluchyj into coherent memory cells that are resizable as taught by Dahlgren to balance memory usage.

Claim 15: Hluchyj discloses memory queues; yet not specifically "allocat[ing] coherent memory cells. Dahlgren teaches allocating coherent memory cells ([0064] lines 1-9 & [0066] lines 1-10: memory... dynamic resizing (allocation)... to a cache coherence protocol). It would have been obvious to one of ordinary skill in the art when the invention was created to modify the queues or memory of Hluchyj into coherent memory cells and allow allocation of the cells as taught by Dahlgren to balance memory usage.

Art Unit: 2416

Claim 4 is rejected under 35 U.S.C. 103(a) as being unpatentable over Hluchyj et al ("Queueing in High Performance Packet Switching," Hluchyj) in view of Kothary (US 6249528 B1).

Claim 4: Hluchyj discloses the claimed invention; yet not specifically "a reassembly unit coupled to the input ports of the node and the switch; and a segmentation
unit with the memory unit and output ports of the node." Kothary shows in figure 2 a reassembly unit coupled to a switch unit, which is coupled to a segmentation unit. The reassembly unit in figure 13 and the segmentation unit in figure 14 both show FIFO
buffers (memory units) 152 and 166 respectively (col. 13: 52-67; col. 14: 42-57). It would
have been obvious to one of ordinary skill in the art when the invention was created to
add the memory unit / re-assembly / segmentation units of Kothary in between the
input-switch-output nodes of Hluchyj for cell re-assembly and segmentation purposes.

Claim 5, 6 and 7 are rejected under 35 U.S.C. 103(a) as being unpatentable over Hluchyj et al ("Queueing in High Performance Packet Switching," Hluchyj) in view of Yang et al (US 5465331, Yang).

Claim 5: Hluchyj discloses the claimed invention; yet not specifically each memory queue is assigned to a memory agent controlling the operation of the memory queue. Yang each memory queue is assigned to a memory agent controlling the operation of the memory queue (col. 2 lines 1-4: plurality of background buffer controllers each coupled to an individual packet memory). It would have been obvious to one of ordinary skill in the art when the invention was created to implement each memory

Art Unit: 2416

queue is assigned to a memory agent controlling the operation of the memory queue as taught by Yang to modify the queues of Hluchyj to provide parallel processing of data.

Claim 6: Hluchyj discloses the claimed invention; yet not very expressively "said memory queues and said memory agents form said switching unit." Yang shows memory queues and memory agents form said switching unit (fig. 4: foreground / background controllers (agents), queue memory QM and connection matrix). It would have been obvious to one of ordinary skill in the art when the invention was created to implement the structure of memory queues and memory agents forming the switching unit as taught by Yang to modify the switch unit of Hluchyj to achieve increased parallel processing of packets.

Claim 7: Hluchyj discloses the claimed invention; yet not very expressively mention "memory agent and memory queues operate asynchronous and in parallel."

Yang teaches memory agent and memory queues operate asynchronous and in parallel (col. 7 lines 7-16: FGAM/BGAM agents store packets in any PM queues in parallel). It would have been obvious to one of ordinary skill in the art when the invention was created to implement the memory agent and memory queues operate asynchronous and in parallel as taught by Yang to modify the switch unit of Hluchyj to achieve increased parallel processing of packets.

Claim 11 is rejected under 35 U.S.C. 103(a) as being unpatentable over Hluchyj et al ("Queueing in High Performance Packet Switching," Hluchyj) in view of Liebowitz et al (US 5757784, Liebowitz).

Art Unit: 2416

Claim 11: Hluchyj teaches the claimed invention; yet not specifically the queues being "burst buffers." Liebowitz teaches in figure 4 the usage of burst buffer 68 in a fragment assembler/disassembler FAD 66 (col. 4: 19-41). It would have been obvious to one of ordinary skill in the art when the invention was made to apply the burst buffer of Liebowitz to the multi-channel node queues of Hluchyj for efficiently handling different data sizes and formats.

Claim 16 is rejected under 35 U.S.C. 103(a) as being unpatentable over Hluchyj et al ("Queueing in High Performance Packet Switching," Hluchyj) in view of Moriwaki et al (EP 0918419 A2, Moriwaki).

Claim 16: Hluchyj teaches the claimed invention; yet has not very specifically shown a network of interactive cascaded multi-channel network nodes. Moriwaki teaches a concept of different levels of inputs and outputs in the ATM switch system from the input highways of the cell distributors to the ATM switches to the output highways of the cell assemblers; therefore, creating a cascade of devices operating in a succession of stages (col. 3 lines 52-58 & col. 4 lines 1-46; fig. 1). The ATM switch units exchange (interaction) cells with other ATM switch units in an N x N switch matrix (col. 6 lines 6-39; abstract, fig. 1). It would have been obvious to one of ordinary skill in the art when the invention was made to apply the concept of cascaded nodes as taught by Moriwaki to the node structure of Hluchyj for swift inter-node communications.

Art Unit: 2416

### Response to Arguments

Applicant's arguments with respect to claims 1 and 14 have been considered but are moot in view of the new ground(s) of rejection with new prior arts.

### Conclusion

The prior art made of record and not relied upon is considered pertinent to applicant's disclosure.

Jarvis, US 5752255: dynamic cache resizing non-coherent cache memory
 Any inquiry concerning this communication or earlier communications from the
 examiner should be directed to Xavier Wong whose telephone number is 571.270.1780.

The examiner can normally be reached on Monday through Friday 8:30 am - 6:00 pm

(EST).

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Seema Rao can be reached on 571.272.3174. The fax phone number for the organization where this application or proceeding is assigned is 571.273.8300.
